

uTrade

API
VERSION
2.0

Date: Aug 2, 2018

Company Overview

uTrade Solutions is a fintech company providing enterprise software for financial trading, including multi-asset trading platform, algorithms and risk management solutions to financial institutions and their end customers. Our product suite includes the following:

- ✓ **centers/cloud** for fastest access to markets to execute arbitrage, market making, execution, excel based, quant driven, API based proprietary and various other **Low latency algorithmic trading platform**: Used in exchange co-location environment or in client data strategies across all asset classes. It also provides FIX APIs for DMA and Algos access.
- ✓ **Multi Asset Trading platform**: with full suite application and html5 web-based front ends (Including admin functions, risk management, order management, connectivity to exchanges etc.). It supports trading for all listed products including equities, futures, options, commodities, as well as for non-listed products like FX etc.
- ✓ **Open Source, Risk Management, and Custom Solutions**: We also customize and open source some modules of our technologies.
- ✓ **Hashcove** - uTrade's partner firm Hashcove is driving new age technology solutions around crowdsourced digital platforms.

We have built our products from ground-up with a modular architecture in order to effectively address current and rapidly evolving user needs. We have also filed for 6 patents in India and 1 patent in US/UK to lead innovation in the trading life cycle.

Please watch our video demos at:

→ www.youtube.com/utradesolutions

→ www.youtube.com/hashcove

uTrade Solutions was recognized as a leading innovative fintech start-up

1.Disclaimer

This information is intended for sharing the product details for the purpose of potential partnership opportunity. No content and the ideas presented hereby maybe re-used, re-distributed or discussed outside of the organization where it is presented (without the prior consent of the author of this document). None of the ideas for financial trading technology presented in these slides maybe copied or shared with parties that could be potentially competing against uTrade Solutions. The information shall not be distributed or used by any person or entity in any jurisdiction or countries where such distribution or use would be contrary to the applicable laws or Regulations. It is advised that prior to acting upon this information, independent consultation / advise may be obtained and necessary due diligence, investigation etc. may be done at the users end. You may also contact us directly for any questions or clarifications. All statements regarding the future are subject to inherent risks and uncertainties, and many factors may lead to actual profits or losses & developments deviating substantially from what has been expressed or implied in such statements.

2. Preface

The objective of this document is to guide the users to understand uTrade's latency sensitive API interface for coding custom strategies. This document explains all the features available in the API 2.0.

3. Scope of Document

The scope of this document is to specify the steps to write custom strategy (both front-end and back-end logic) which can work with uTrade's latency sensitive algorithmic trading platform. It explains various features of the API 2.0, does not cover the in-built strategies which come with the uTrade platform.

4. Overview

- ✓ uTrade's API 2.0 provides backend infrastructure, which allows you to create your own latency sensitive strategies and run with uTrade's latency sensitive trading platform.
- ✓ Custom strategies can be written only in C++ (Linux platform)
- ✓ New custom strategies can be integrated and run in the platform on the fly with no effect on the already running strategies. They can be run from the same front-end.
- ✓ Risk Management features are also available, same as the trading platform.
- ✓ You will have to code only for backend strategy.
- ✓ You need to generate Frontend using an in-built tool.
- ✓ Custom strategy can be run with both TBT and snapshot feed. Latest data (order book) is provided to the strategy on request basis.
- ✓ API 2.0 supports all segments of NSE, BSE, SGX, CFH

5. Steps for writing and running custom strategy

- ✓ You need to generate front-end using an in-built tool
- ✓ You need to code and create custom strategy .so file (as shared object or dynamic library)
- ✓ At back-end, you need to copy the .so to custom strategy folder.

Now, to run the strategy from front-end, you need to specify the name of .so file.

- ✓ Automatically, the strategy gets loaded in the application
- ✓ Now you can run the strategy

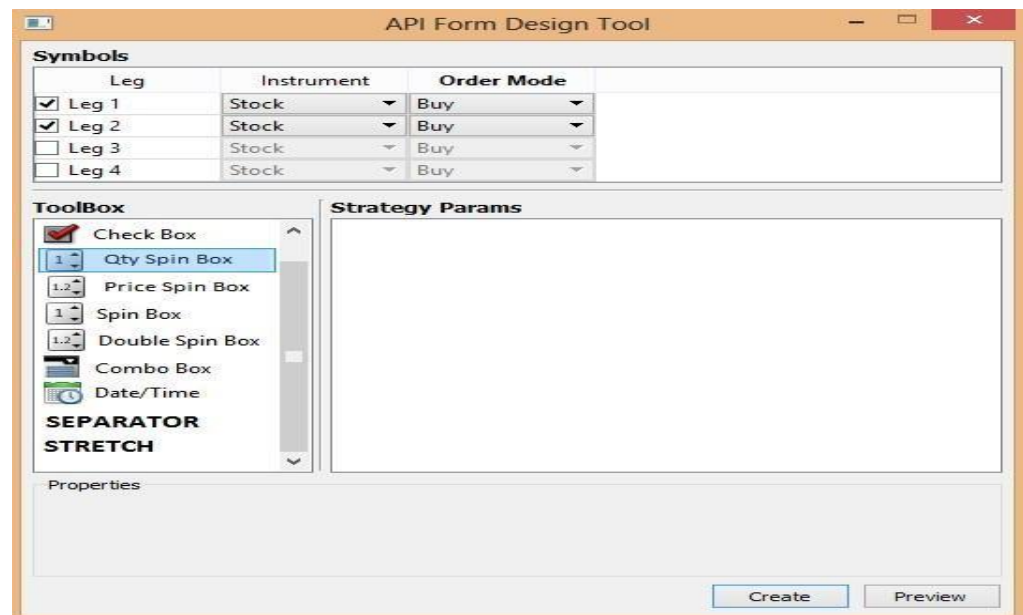

6. Designing Front-end for Custom Strategy

Select parameters from tool box that you wish to see on the frontend window.

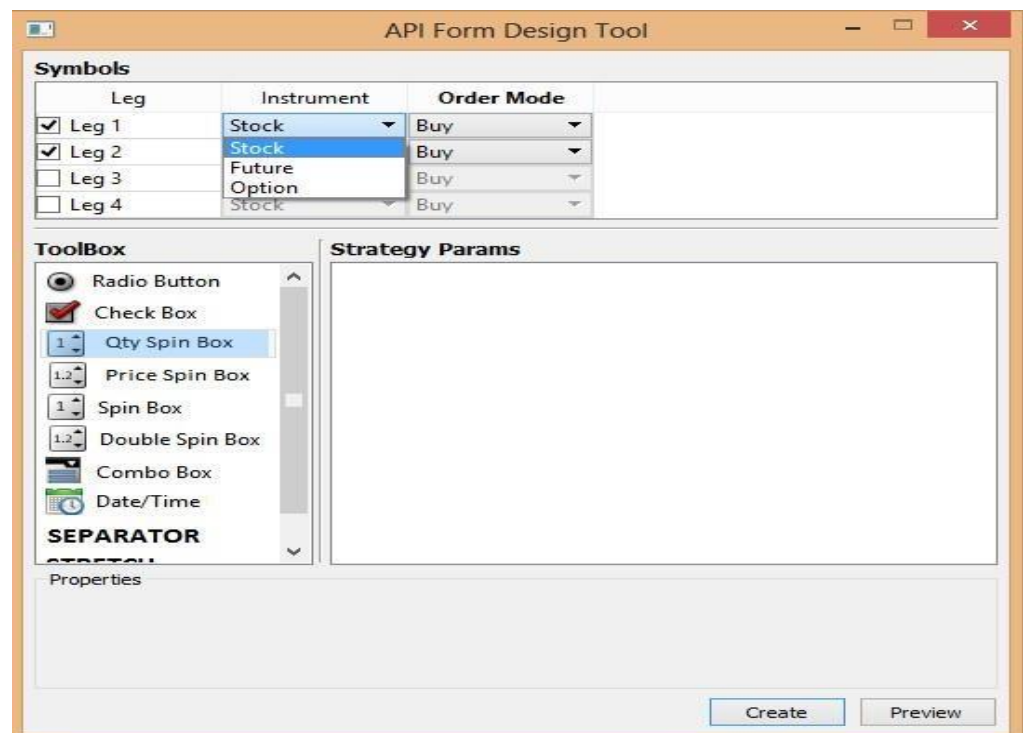

Depending on the type of parameter, front-end form gets generated where you can fill values based on logic, and integrate with the custom strategy back-end implementation.

6.1 Tool Box

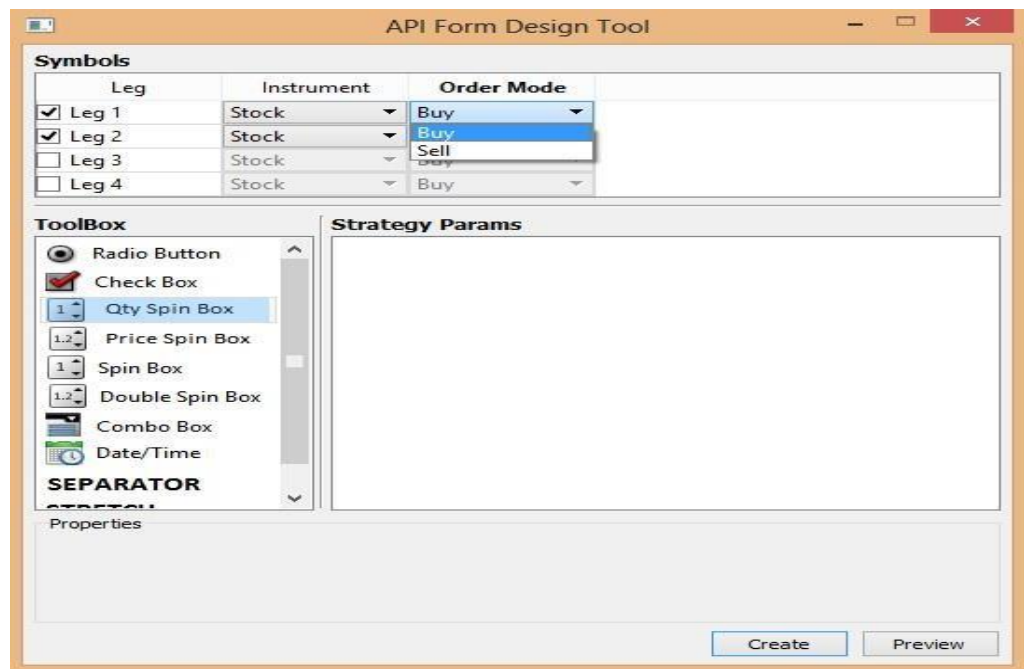

Select number of legs you want to view on the front-end to run your custom strategy. For e.g. if you want to create a 2 leg strategy, select two legs.

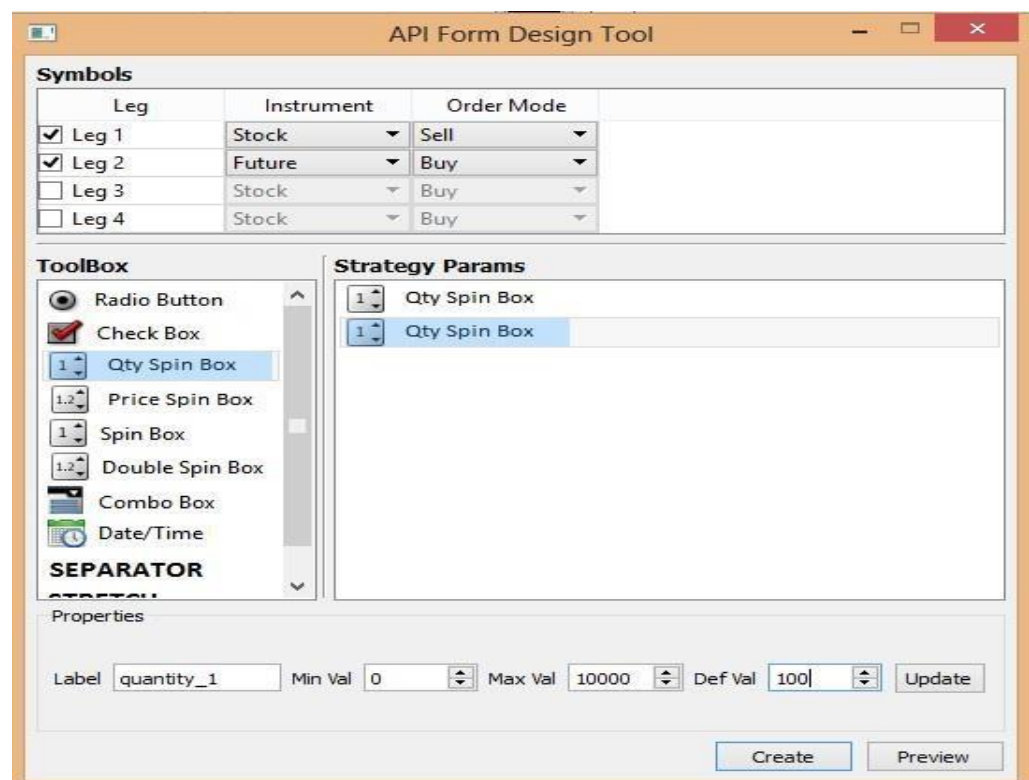

Select default instrument for different legs. If you want to run cash future strategy, select stock for first leg and future for second leg.

Select, buy or sell options for different legs. For e.g. if you want to sell cash and buy futures, select sell for leg one and buy for second leg.

Select Spin box for entering quantity or whole values. Define label like Order Quantity, define value range min and max, enter default value you want to trade on and update.

The screenshot shows the 'API Form Design Tool' window. At the top, there's a 'Symbols' table with columns 'Leg', 'Instrument', and 'Order Mode'. Below it, a 'ToolBox' contains various UI controls like Radio Button, Check Box, Qty Spin Box, Price Spin Box, Spin Box, Double Spin Box, Combo Box, and Date/Time. The 'Price Spin Box' is selected in the toolbox. In the 'Strategy Params' section, a 'Price Spin Box' is added to the list. The 'Properties' section at the bottom shows fields for 'Label' (price_2), 'Min Val' (0.00), 'Max Val' (99.00), and 'Def Val' (0.00), with an 'Update' button.

Leg	Instrument	Order Mode
<input checked="" type="checkbox"/> Leg 1	Stock	Sell
<input checked="" type="checkbox"/> Leg 2	Future	Buy
<input type="checkbox"/> Leg 3	Stock	Buy
<input type="checkbox"/> Leg 4	Stock	Buy

ToolBox

- Radio Button
- Check Box
- Qty Spin Box
- Price Spin Box**
- Spin Box
- Double Spin Box
- Combo Box
- Date/Time
- SEPARATOR

Strategy Params

- Qty Spin Box
- Qty Spin Box
- Price Spin Box**

Properties

Label: price_2 Min Val: 0.00 Max Val: 99.00 Def Val: 0.00 [Update]

[Create] [Preview]

Select double spin box for entering price or rational numbers. Define label like Min Profit, define price range min and max, set default price you want to trade on and update.

The screenshot shows the 'API Form Design Tool' window. The 'ToolBox' now has 'Combo Box' selected. In the 'Strategy Params' section, a 'Combo Box' is added to the list. The 'Properties' section at the bottom shows fields for 'Label' (combobox_3), 'Value' (empty), and buttons for 'Add', 'Remove', and 'Update'.

Leg	Instrument	Order Mode
<input checked="" type="checkbox"/> Leg 1	Stock	Sell
<input checked="" type="checkbox"/> Leg 2	Future	Buy
<input type="checkbox"/> Leg 3	Stock	Buy
<input type="checkbox"/> Leg 4	Stock	Buy

ToolBox

- Radio Button
- Check Box
- Qty Spin Box
- Price Spin Box
- Spin Box
- Double Spin Box
- Combo Box**
- Date/Time
- SEPARATOR

Strategy Params

- Qty Spin Box
- Qty Spin Box
- Price Spin Box
- Combo Box**

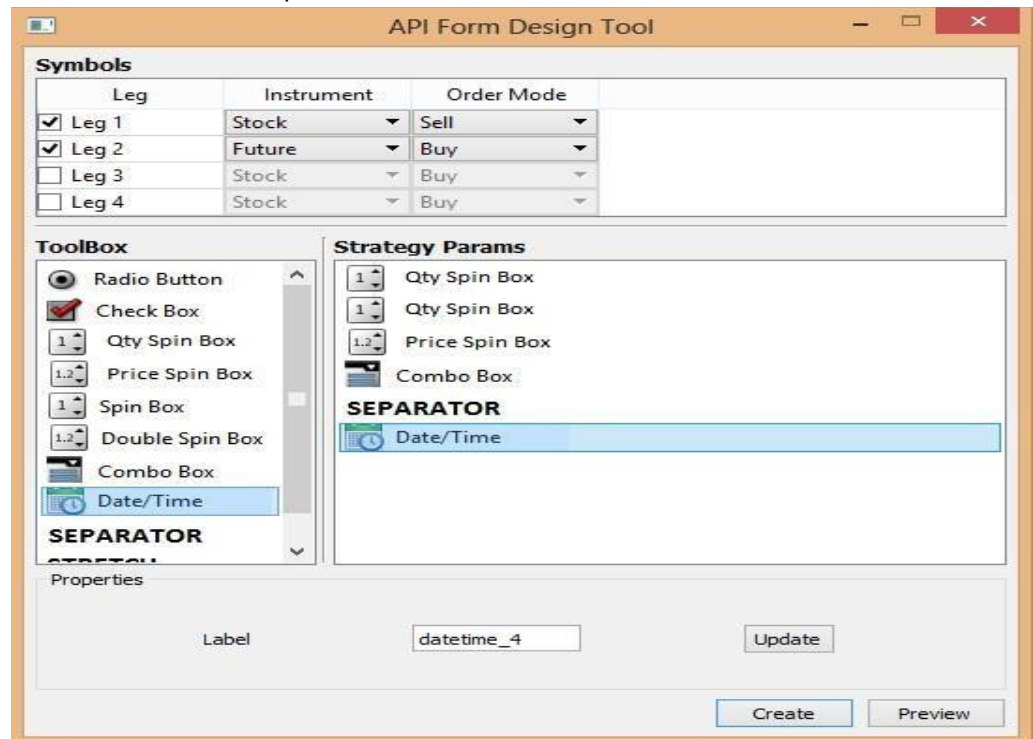

Properties

Label: combobox_3 Value: [Add] [Remove] [Update]

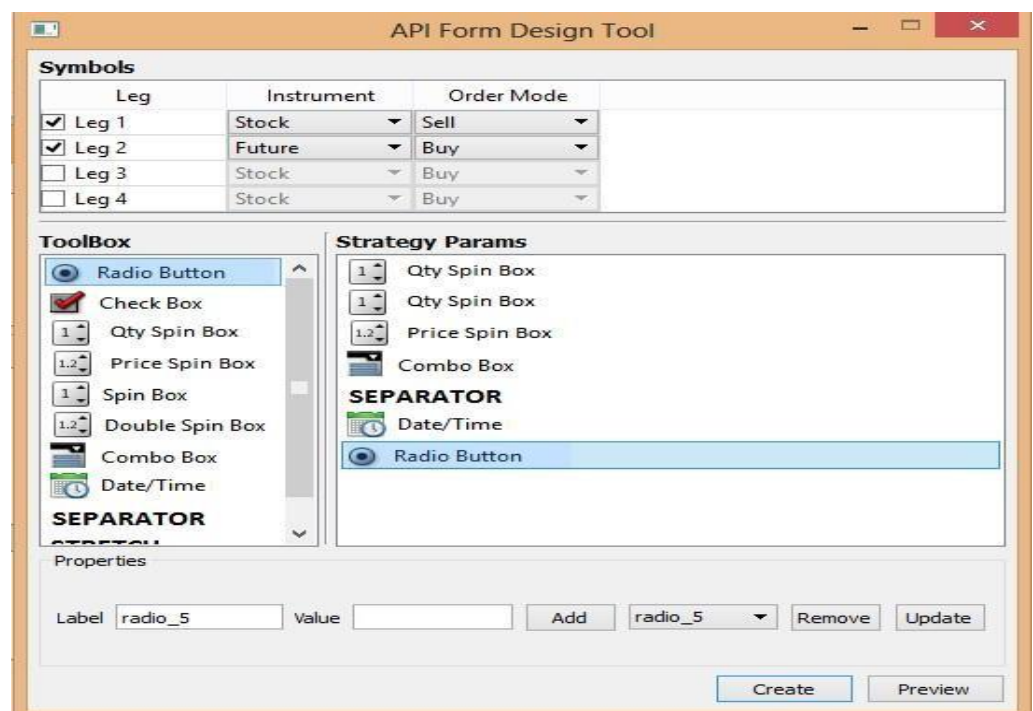

[Create] [Preview]

Combo will give a drop-down option. Label the Combo like Hedge Methods, add values like best bid, best ask, etc. you

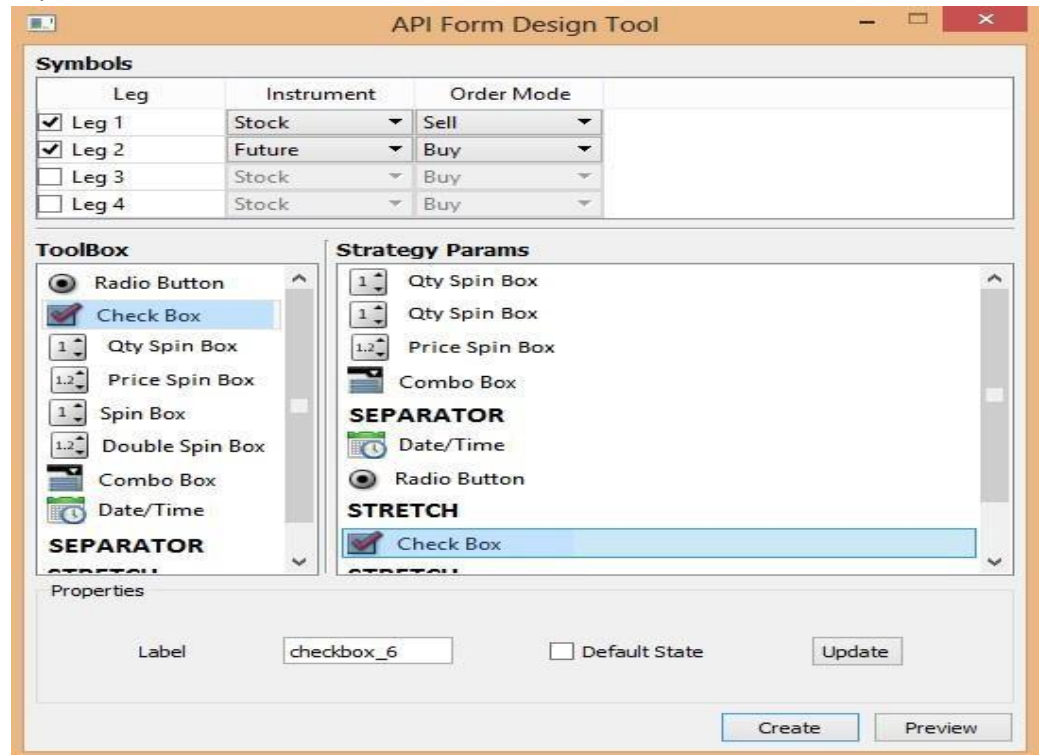

can add or remove the values, click on the value you want to see as default and update.

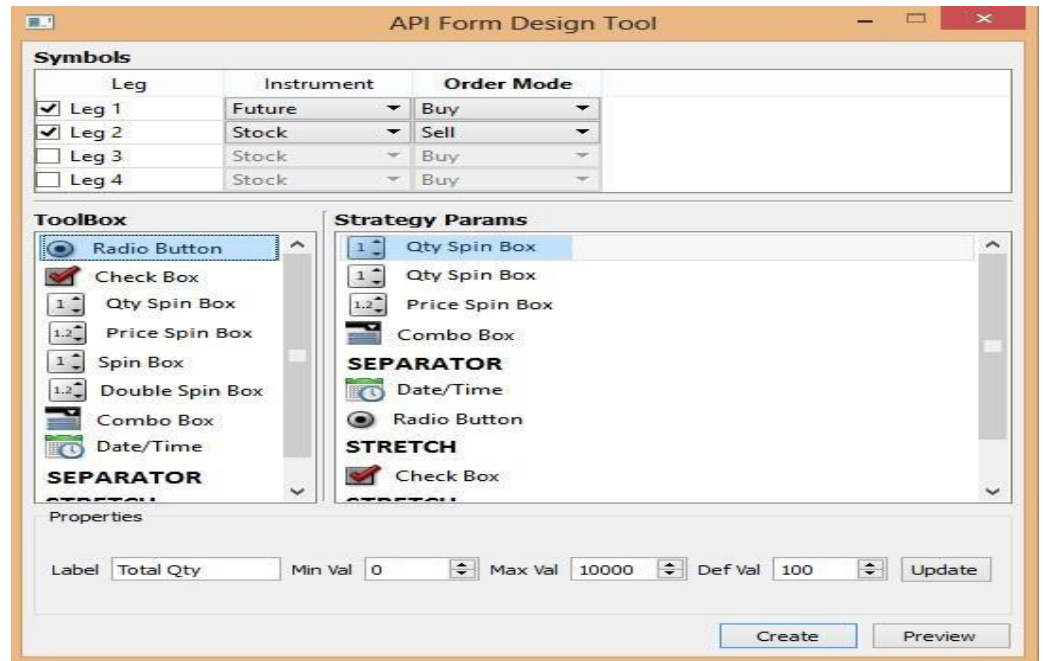

Separator adds a horizontal line and date/time adds a box with timer. You only have the option to edit the label.

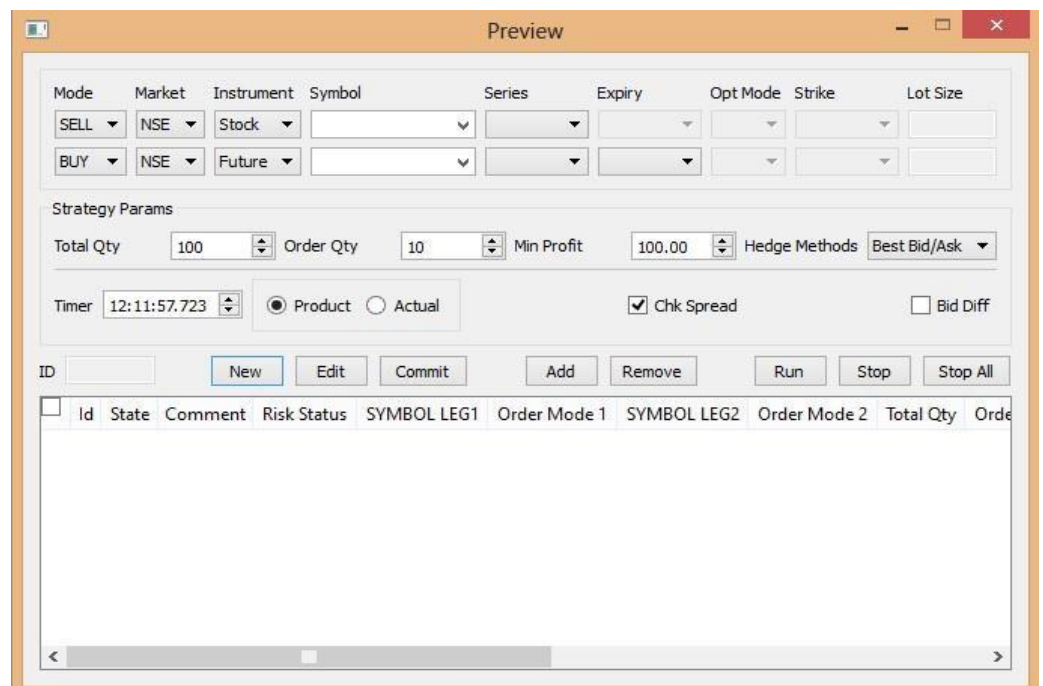

Radio allows you to select either of the options; you have to add minimum 2 values in radio. Label will not appear on the screen, you can only view the values, select one of the value and update.

Stretch will create a gap between two different parameters. Check box allows you to select multiple options; you can select more than one option. Add label to the check box, select on default state if you want this particular box to be checked.

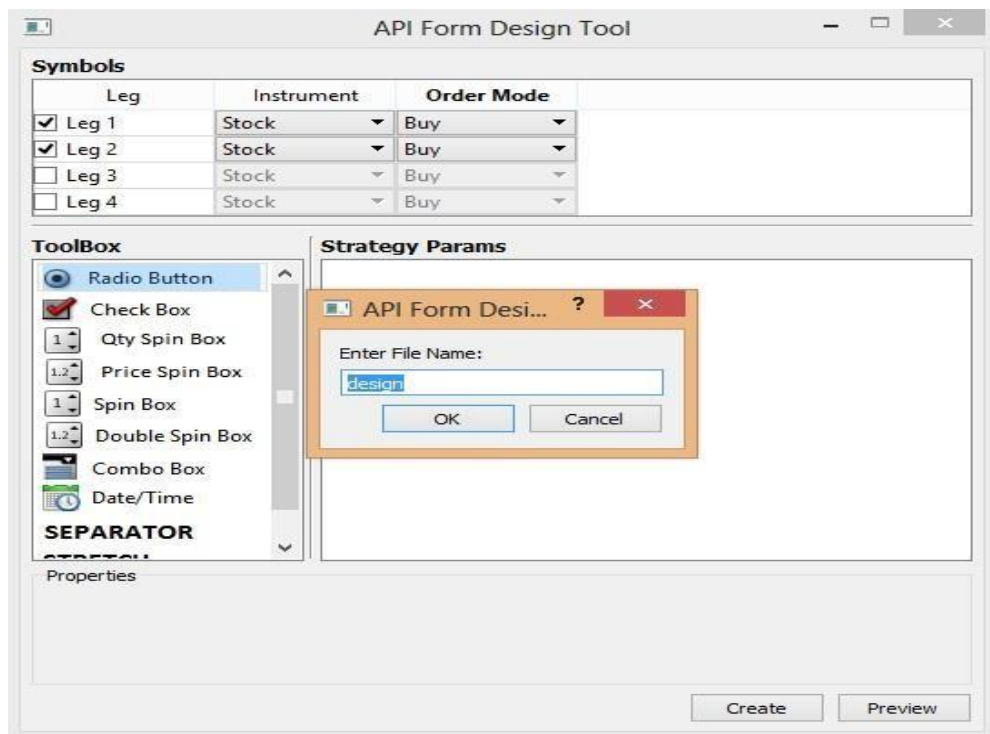

Click on preview to see the window which will appear on frontend.

Based on your criteria and your default selection, this is how your front-end window will appear. If you don't want to modify, click on create and add enter file name

The file will be created, go to your application folder and find the name of the file, open in notepad to view the code.

The **code** thus generated will be:

```
[SYMBOL]
SYMBOL LEG1=UINT64:F
Order Mode 1=UCHAR:1
SYMBOL LEG2=UINT64:F
Order Mode 2=UCHAR:0
[STRATEGY_PARAMS]
Total Qty=UINT64:SPINBOX:0:99999:1:Q
Order Qty=UINT64:SPINBOX:0:99999:1:Q
Min Profit=FLOAT:DSPINBOX:0.00:999.00:0.05:P
Hedge          Method=COMBO:Market          Order:Best
Bid/Ask:Best Ask/Bid:Best Bid/Ask
SEPARATOR=1
Timer=TIMER
Spd Type=RADIO:Product:Actual:Def Rule:Actual
STRETCH=1
Bid Diff Chk=BOOL:0
Bid Diff Val=UINT64:SPINBOX:0:999:0
```

[OTHER]

This file is required for **back-end implementation**.

6.2 How to use different parameters

6.2.1 COMBO

Name=COMBO:Data 1:Data 2:Data 3

Combo is used to create any parameter with drop down option, like in above mentioned image you can click on drop down option and select different hedge methods.

6.2.2 RADIO

Name=RADIO:Radio 1:radio 2:radio 3:radio 2

Last value (radio 2) is default checked radio button.

Radio is used where parameter can be selected among multiple options; however you can choose only one option. Radio is represented by circle. In above image you have multiple options, but you can only select either of the two.

6.2.3 CHECK BOX

Checkbox is used where parameter can be selected as true/false. Bool is represented by a check/ square box.

6.2.4 SEPARATOR will create a horizontal line

Separator is used where you want to divide the window to show different parameters in different row. In above image total qty, order qty, min profit and hedge methods are separated by horizontal line from other parameters like timer, product, actual, chk spread and bid diff.

6.2.5 STRETCH will create some space in between two controls.

Stretch is used to create gap between the two parameters. In above image you can see there is a stretch between actual and chk spread, and chk spread and bid diff.

6.2.6 Create box for quantity parameter

`Qty=UINT64:Q`

Q will be used for quantity.

To create box for values in whole number UINT64 is used. In above image to define quantity, which is a whole number, UINT64 is used. (SPIN BOX)

6.2.7 Create box for price parameter

`Min Profit=FLOAT:P`

P will be used for Price.

To create box for values in natural number FLOAT is used. In above image to define price, which is a natural number, FLOAT is used. (DOUBLE SPIN BOX)

Note:

1. Whenever you are creating a symbol bar, order mode with it is compulsory. e.g.

`SYMBOL LEG1=UINT64`

`Order Mode 1=UCHAR`

2. Line starting with # is comment and can't be used. e.g.

`#SYMBOL LEG3=UINT64`

7. Steps for writing a strategy (back-end implementation)

7.1 Create an external interface

Your strategy will run in the same process as muTrade backend application, your strategy will be created as a shared object.

The following functions are mandatory to be present:

```
extern "C"
```

```
{
```

```
// inside extern "C" Specifier
```

```
std :: string getFrontendDesign();
```

It is used to get the script file which will be passed to frontend, further it will render the GUI design using which you strategy will run.

```
void * getDriver(void * params);
```

It will be called when front-end issues strategy run command to the back-end.

Here params will point to object of class SG::Parameters defined in sgLib/sgApiParameters.h

```
}
```

Both of the above functions will need to be place under <extern "C"> specifier.

The strategy will be running inside the HFT back-end.

See [API-Documentation](#)

7.2 Inherit from API2::SGContext

Here you need to write your own class which inherits [API2::SGContext](#).

[API2::SGContext](#) provides various functionalities such as Market Data Subscription, Order Execution, OrderBook and Net Position processing and will provide your derived class various Event call-backs for different types of Order Confirmations.

See [API-Documentation](#)

7.3 Write your core strategy logic in your derived class.

Here you need to write your core strategy logic, which will be executed on various Events provided such as

7.3.1 Market Data Event:

For enabling this event use:
marketDataEventRequired = true while starting the algo

See [API-Documentation](#)

This event call-back is generated whenever there is a change in market feed for the subscribed Feed Type (TBT Feed or Snapshot Feed)

7.3.2 On Frontend Command:

This event call-back is generated whenever there is a command from frontend, like stop/modify strategy etc

See [API-Documentation](#)

7.3.3 On Order Confirmations:

This event call-back is generated whenever an Exchange Order Confirmation (new/modify confirmed/rejected/partially-filled/filled) is received. The call-back is generated after process the Confirmation.

See [API-Documentation](#)

7.3.4 General Event call-back:

([API2::SGContext::processCurrentState](#))

This call-back is generated if none out of the above event has occurred.

For enabling this event use `marketDataEventRequired = false` while starting the algo using [API2::SGContext::startAlgo\(\)](#)

See [API-Documentation](#)

7.4 Drive the algo:

Read the front-end parameters and construct object for your derived class and call the [API2::SGContext::startAlgo\(\)](#)

8. Things to do before calling Start Algo

8.1 Add all the instruments to be used in the strategy.

- To add an instrument use **API2::SGContext::addInstrument** or **API2::SGContext::getAddInstrument**
- If required for market data subscription, set the subscription parameters accordingly.

See [API-Documentation](#)

By calling the above functions, a new instrument is created and market data is subscribed as requested, for that particular symbol (configurable). This function will set up instrument, which will aid you with functionalities such as to monitor, Net Positions, Order Status etc.

8.2 Choose start Algo function argument

After market data subscription, you can call [API2::SGContext::startAlgo](#) function; this takes a single argument, **marketDataEventRequired**.

- **If it is set to true**, then strategy will receive an event, every time feed changes in any symbol, registered.

All symbols that are subscribed infra will monitor them and whenever feed change is detected event callback

`onDerivedMarketDataEvent` is generated

- **If it is set to false**, then strategy is responsible to update quote, to receive latest quotes.

Whenever a general event call-back `API2::SGContext::processCurrentState` is generated infinitely.

The algo is required to update Market Data, by calling `API2::SGContext updateQuote()` to update market data.

9. Special Notes

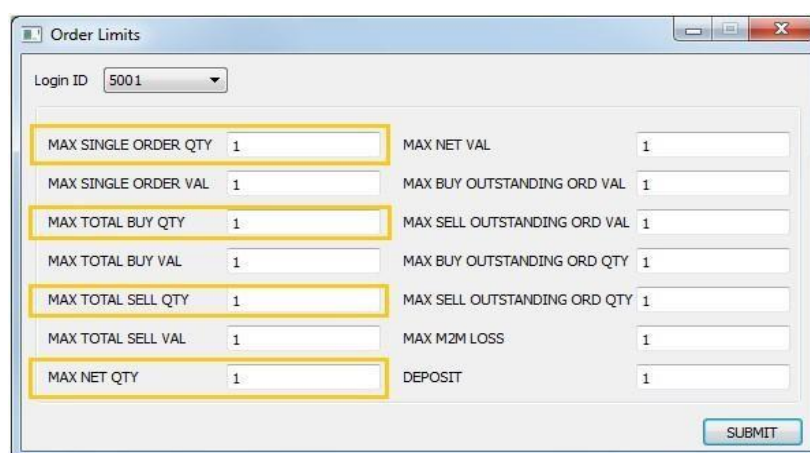

-
- ✓ Market data shall be subscription based, both TBT and snapshot feed can be subscribed by custom strategy. Latest data shall be provided.
 - ✓ SDK type environment with a customer language to write strategy shall NOT be provided
 - ✓ C++ API shall only be supported
 - ✓ Backend will need to put checks on the data types of strategy parameters

10. Risk Management

10.1 Quantity Limits Check

The trading platform validates Order Quantity, and the order generation takes place only if it complies with the Surveillance Measures set for the User with respect to Maximum Single Order Quantity (both Buy/Sell), Maximum Total Order Quantity (both Buy/Sell) and Maximum Net Quantity.

The screenshot shows a window titled "Order Limits" with a "Login ID" dropdown set to "5001". Below this, there are two columns of input fields, each with a "1" in the text box. The fields are:

Field	Value
MAX SINGLE ORDER QTY	1
MAX SINGLE ORDER VAL	1
MAX TOTAL BUY QTY	1
MAX TOTAL BUY VAL	1
MAX TOTAL SELL QTY	1
MAX TOTAL SELL VAL	1
MAX NET QTY	1
MAX NET VAL	1
MAX BUY OUTSTANDING ORD VAL	1
MAX SELL OUTSTANDING ORD VAL	1
MAX BUY OUTSTANDING ORD QTY	1
MAX SELL OUTSTANDING ORD QTY	1
MAX M2M LOSS	1
DEPOSIT	1

A "SUBMIT" button is located at the bottom right of the window.

10.2 Order Value Check

The valid Order Value Generation takes place only if it complies with the Surveillance Measures set for the User with respect to Maximum Single Order Value (both Buy/Sell), Maximum Total Order Value (both Buy/Sell) and Maximum Net Value.

Order Limits

Login ID: 5001

MAX SINGLE ORDER QTY	1	MAX NET VAL	1
MAX SINGLE ORDER VAL	1	MAX BUY OUTSTANDING ORD VAL	1
MAX TOTAL BUY QTY	1	MAX SELL OUTSTANDING ORD VAL	1
MAX TOTAL BUY VAL	1	MAX BUY OUTSTANDING ORD QTY	1
MAX TOTAL SELL QTY	1	MAX SELL OUTSTANDING ORD QTY	1
MAX TOTAL SELL VAL	1	MAX M2M LOSS	1
MAX NET QTY	1	DEPOSIT	1

SUBMIT

10.3 Price Range check

The order price generation mechanism strictly follows the specified Range provided to a trader to limit the risk within a pre-set percentage of the Last Trade Price (LTP). The percentage will be greater than zero and less than or equal to the applicable circuit limits including dummy circuit limits in respect of all algorithmic/single orders.

Global Risk Parameters

MAX ORDERS PER SECOND	999,999	MARKET PROTECTION (%)	10.00
LIMIT PRICE PROTECTION (%)	20.00	BRANCH DEPOSIT NSE	9,999,999,999
NSE INDEX PROTECTION (%)	10.00	BRANCH DEPOSIT BSE	99,999,999,999

OPTION MARGIN %age NSE	100.00	CLOSE PROTECTION (%)	40.00
OPTION MARGIN %age BSE	100.00		

SUBMIT

10.5 Trade Price Protection Check (Bad trade Protection)

By defining a field value in Bad Price Protection % Change, order price generation can be restricted within a set percentage of last two LTP (Last trade price). Algo trade generation beyond set price bracket will result into rejection/freeze of the respective Algo rule until consecutive LTP received is within the set % range.

Global Risk Parameters			
MAX ORDERS PER SECOND	100,000	MARKET PROTECTION (%)	5.00
LIMIT PRICE PROTECTION (%)	40.00	BRANCH DEPOSIT NSE	99,999,999,999

11. Compliance Requirements

11.1 Order Identification

The orders generated through Algo Platform are identified with unique order number as per the exchange criteria.

11.2 Non- Tamper able Audit Trial

Access to system is restricted to authorized person permitted by the system administrator. System has provision to create daily backup for trade log, Message log, and User maintenance back up, Order history back up, etc.

11.3 Orders per second

Maximum number of Order released per second by the Algo platform is in accordance with the exchange criteria.

11.4 Automated Execution Throttle

The Algo platform has In-built functions to ensure that next set of orders are generated only after fulfilment of first phase of Trade cycle.

11.5 System security

Access to system is restricted to authorized person permitted by the system administrator with valid User Id and Password.

Some more characteristics are:

- ✓ Automatic disablement of the user on entering erroneous password on three consecutive occasions.
- ✓ Automatic expiry of password on expiry of 14 calendar days.
- ✓ The Passwords are alphanumeric, instead of just being alphabets or just numerical.
- ✓ System doesn't allow the changed password to be the same as the last password
- ✓ Login id of the user and password cannot be the same.
- ✓ Minimum password length is eight characters and not more than twelve characters.
- ✓ The Passwords are stored in encrypted form to safe guard against any misuse

11.6 Control Values

Audit trail created in our system captures the record of control parameters, orders, trades and data points emanating from trades executed through algorithm trading. Field values are made mandatory for all risk control parameters, and no risk parameters have provision to accept unlimited value or Zero value.

Before sending any order to exchange trading system, the orders are mandatorily filtered through the Surveillance system. Those orders which are within the set parameters will only flow to the exchange.

11.7 Dysfunctional Algos

- ✓ Surveillance measures to check total cumulative Buy/Sell Quantity, Total Net Quantity are built into the system to restrict/identify position building on one side or overall basis. Further orders in excess of set standards of Surveillance will freeze/rejected. System has functions to restrict the entry on number of rules.
